Which Antibiotics Can Dogs or Cats Take?

There are four types of microorganisms that can cause infection in or on your pet's body. These tiny microbials include bacterium, viruses, fungi, and protozoa. Your veterinarian typically determines what type of pet antibiotic medication to prescribe only after making a diagnosis and determining what type of organism is causing the problem. The pet antibiotic you should use to treat your furry companion depends on which organism you're fighting and how the medication works in your pet's body.

Bacterial infections Bacteria invades your pet's body in any number of ways: through open wounds, in something your pet eats, or just by cohabiting in the same environment as your pet. They come in different shapes and sizes, and it is those physical characteristics that help your veterinarian determine which bacteria are infecting your animal. Responsible for gastroenteritis, pneumonia, skin infections, urinary tract problems, and a host of other diseases, these tiny, one-celled organisms can multiply unchecked in your pet's body without the intervention of antibiotics.

How do antibacterials work? Bacterial antibiotics work to destroy the offending cells while leaving your pet's healthy cells intact. Depending on the medication, an antibiotic might inhibit the bacterium's ability to construct cell walls, thus destroying its ability to reproduce. An antibiotic can also starve the bacterium by stopping its ability to transform glucose into energy, a major function of all living cells. Common antibiotic medications for pets include: Enrofloxacin (Baytril) - respiratory, skin, and urinary tract infections
Amoxicillin/Clavulanic acid (Clavamox) - wounds, respiratory infections, skin infections
Metronidazole ..(periodontal disease
Clindamycin (Antirobe) - bacterial, soft tissue, bone, and dental infections
Viral infections Viruses are the organisms responsible for canine distemper, canine parvovirus, feline herpes, and the feline calici virus, as well as a myriad of other diseases that can make your pet very ill. These parasites can multiply only inside the living cells of other organisms and
